# New Measures of Deprivation in the Republic of Ireland

An Inter-temporal and Spatial Analysis of Data from the Census of Population, 1991, 1996, 2002 and 2006

Trutz Haase & Jonathan Pratschke

Presentation to Partnerships, 17th & 18th June 2008

# History of Irish Deprivation Measures

Local E	Development Programme & Pobal	Development of Deprivation Index
1991	Designation of 12 Pilot Areas to combat long-term unemployment under the PESP	
1992	ADM is given responsibility for the management of area-based integrated social and economic development programmes	First Analysis of 1986 Census data (ESRI & CPA, 1993)
1992-1995	Programme goes 'national' under the Global Grant, extending the designation to 38 Partnerships and 33 Community Groups	First Index of Relative Affluence and Deprivation, based on 1991 Census data (Haase 1993, 1996)
1994-1999	Local Development Programme becomes separate Programme under the NDP (OPLURD)	Second Index of Relative Affluence and Deprivation, based on 1996 Census data (Haase 1999)
2000-2006	Local Development Social Inclusion Programme (LDSIP)	First Index of Relative Affluence and Deprivation, using new methodological approach, based on 1991, 1996 and 2002 Census data (Haase & Pratschke 2005)
2006-2013	Continuation of LDSIP after 'Cohesion'	New Measures of Deprivation, based on 1991, 1996, 2002 and 2006 Census data (Haase & Pratschke 2008)

### Male Unemployment Rate 1991 - 2006

#### Main Observations

Social & Economic Consultant

Trutz Haase

rate has exactly halved in 15 years
differentials largely maintained
reversal (2006) in all cities, except Cork

**Dublin City** South County Dublin **Dublin Fingal** Dun Laoghaire/Rathdown Kildare Meath Wicklow Carlow Kilkenny Wexford **Tipperary SR** Waterford City County Waterford Cork City County Cork Kerrv Clare Limerick City **County Limerick Tipperary NR** Galway City **County Galway** Mayo Roscommon Louth Leitrim Sligo Cavan Donegal Monaghan Laois Longford Offalv Westmeath Dublin 1991 \_ Mid East South East 1996 South West Mid West 2002 West Border **———2006** Midlands Southern&Eastern Border, Midlands&Western Ireland 30% 25% 20% 15% 10% 5%

### **Main Observations**

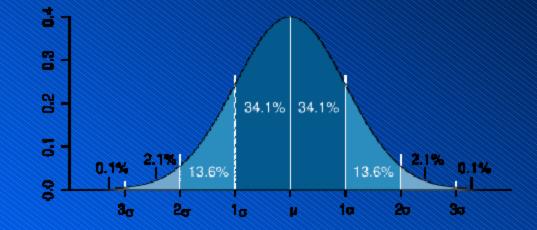

Ireland has experienced an exceptional and sustained economic boom over the past 15 years.

All social indicators exhibit significant improvements and these affect all areas.

It is thus important to interpret changes at local level in the context of the general trends.

### **Grading Outcomes for Mapping**

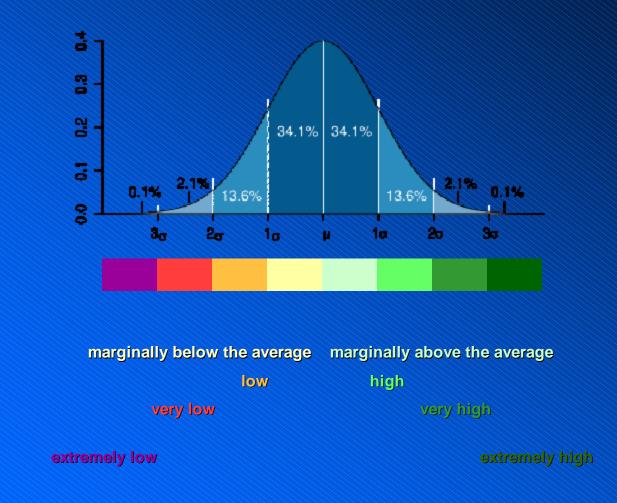

Many social phenomena – including all of the indicators used in the construction of the Irish Measures of Deprivation – follow what is known as the normal distribution, a bell-shaped curve.

This allows an easy way to express how different a particular observation is from all other observations, by using units of standard deviation.

One standard deviation from the mean accounts for about 68% (dark blue), two standard deviations from the mean (medium and dark blue) account for about 95% and three standard deviations (light, medium, and dark blue) account for about 99.7%.

### **Assigning Colour Codes**

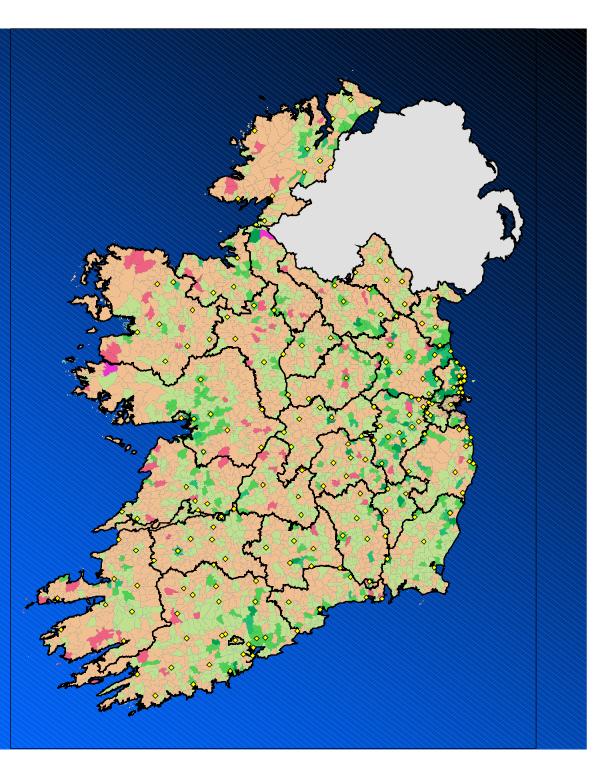

### Population Change 2002 - 2006

#### Main Observations

strongest growth in urban peripheriesbut population declining in most city areas

Population Change 2002 - 2006							
	59 to 348						
	42 to 59 25 to 42 8 to 25						
	25 to 42						
	8 to 25						
	-9 to 8						
	-26 to -9						
	-37 to -26						

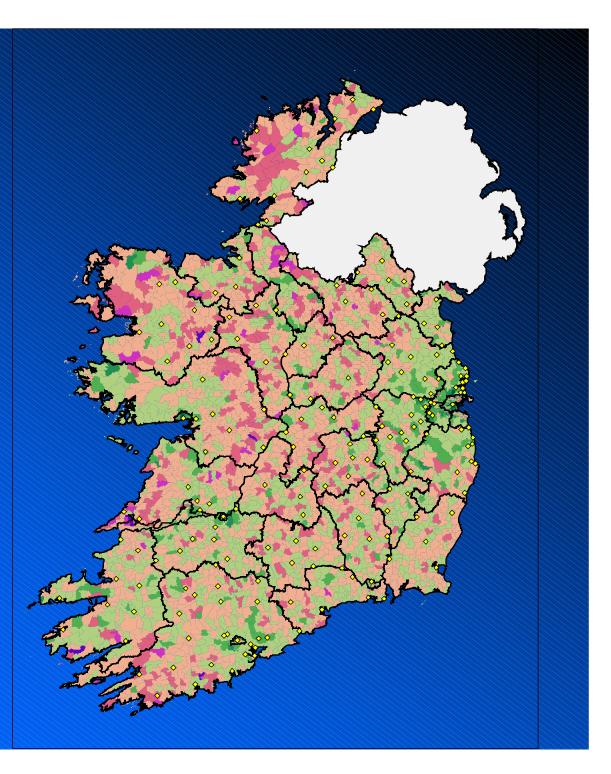

### Age Dependency Rate 2006

#### Main Observations

lowest rates in urban peripheries
highest rates in (remote) rural areas

Age Dependency Rate 2006 47.9 to 50 43.2 to 47.9 38.5 to 43.2 33.8 to 38.5 29.1 to 33.8 24.4 to 29.1 19.6 to 24.4 8.5 to 19.6

# Lone Parent Rate 2006

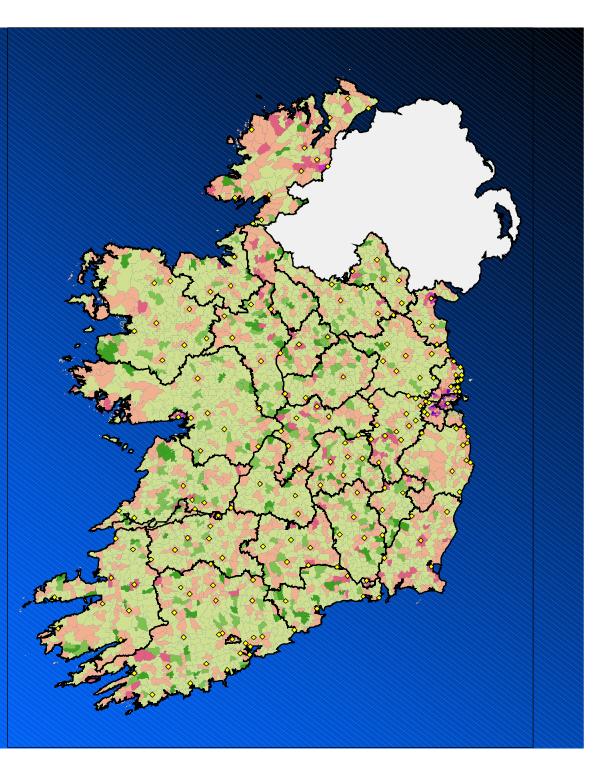

#### Main Observations

high rates found only in urban areas
reaching over 50% in disadvantaged inner city areas

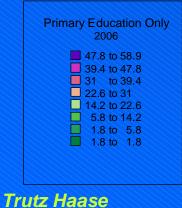

Social & Economic Consultant

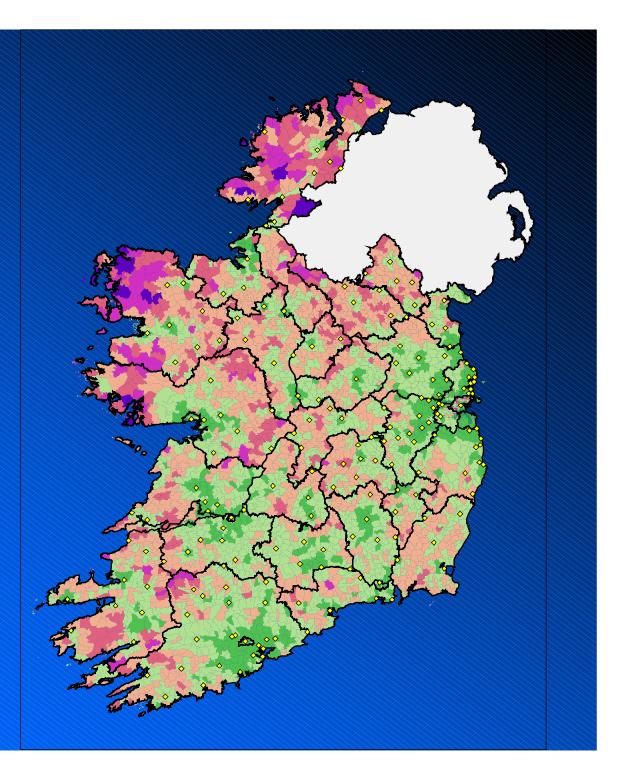

Proportion of Adult Population with Primary Education only 2006

#### Main Observations

- lowest in urban periphery
- highest in (remote) rural areas
- cities containing both

Social & Economic Consultant

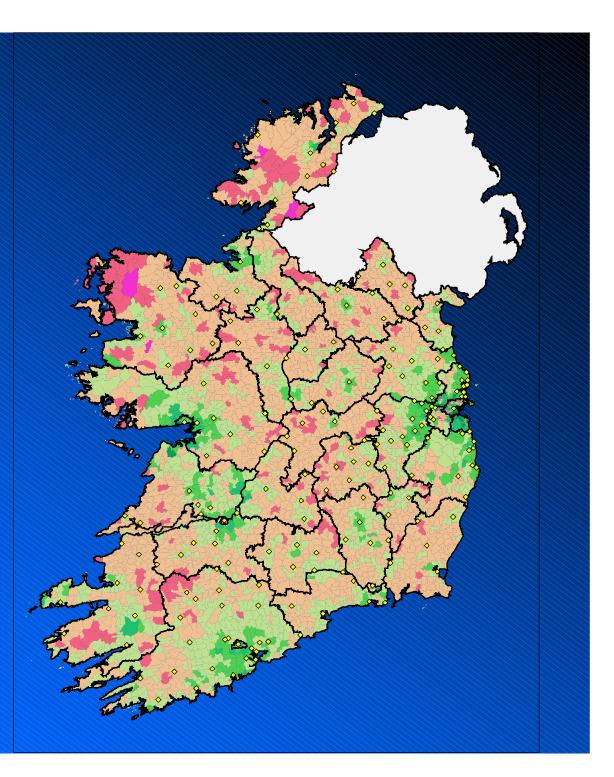

Proportion of Adult Population with Third Level Education 2006

#### Main Observations

mirror image of low education
not as pronounced in rural areas

Third Level Education 2006
55.7 to 76.6
45.6 to 55.7
35.5 to 45.6
25.4 to 35.5
15.3 to 25.4
5.2 to 15.3
2 to 5.2

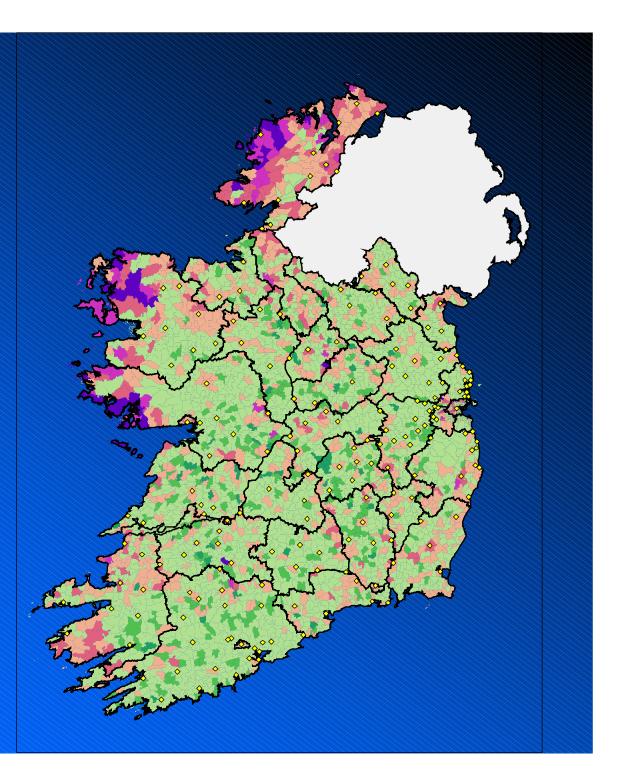

### Male Unemployment Rate 2006

#### Main Observations

 highest in remote rural and clisadvantaged urban areas

Male Une	mployment Rate 2006
	23.7 to 56.5 18.3 to 23.7 13 to 18.3 7.7 to 13 2.4 to 7.7 0 to 2.4

### **Main Observations**

Many social indicators have similar geographical distributions.

A picture emerges whereby the urban peripheries appear to be the most affluent parts of the country and disadvantage is concentrated either in central urban areas or remote rural areas.

# The Need for a Composite Index

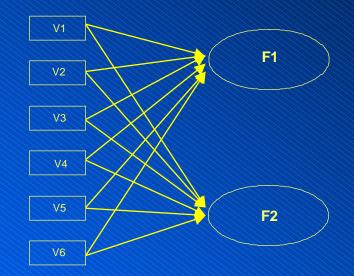

### The Purpose of Composite Indices

- 1. It is difficult to simultaneously comprehend the multiplicity of observations across multiple indicators at different points in time.
- 2. For practical purposes, there is a need for a single indicator which draws all of these observations together.
- 3. Such an index can provide the basis for the effective targeting of the most disadvantaged areas.
- 4. This can provide a means by which to assess changes over time, and facilitate monitoring and evaluation.
- 5. However, it is important that such an index enjoys broad support amongst all key stakeholders, including Government Departments, state agencies and community representatives.

# The New Measures of Deprivation for the Republic of Ireland

## Traditional Approach: Exploratory Factor Analysis (EFA)

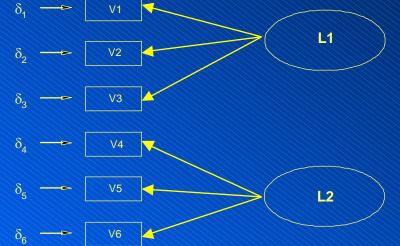

Ordinary Factor Analysis reduces variables to a smaller number of underlying Dimensions or Factors

- EFA is essentially an exploratory technique; .i.e. data-driven
- all Variables load on all factors
- □ the Structure Matrix is the (accidental) outcome of the variables available
- □ does not allow for measurement error (v1-v6 are assumed to be perfect indicators)
- □ can not be used to compare outcomes over time

### New Approach: Confirmatory Factor Analysis (CFA)

- **Confirmatory Factor Analysis also reduces observations to the underlying Factors, however**
- variables are conceptualised as the (imperfect) manifestations of underlying or latent concepts

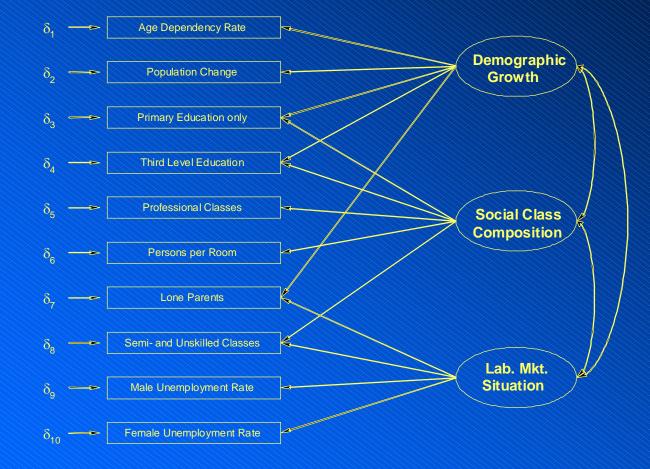

- **CFA requires a strong theoretical justification before the model is specified**
- the researcher decides which of the observed variables are to be associated with which of the latent constructs
- variables are assumed to be imperfect manifestations (i.e. allowing for measurement error)
- model allows the comparison of outcomes over time
- □ facilitates the objective evaluation of the quality of the model through fit statistics

### The Underlying Dimensions of Social Disadvantage

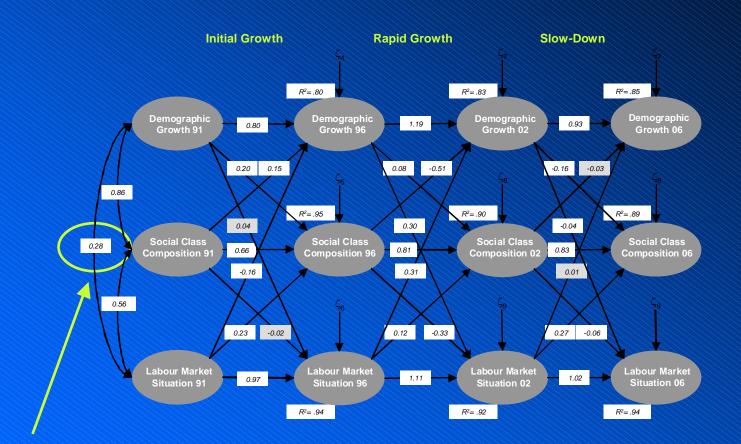

#### Demographic Decline (predominantly rural)

- population loss and the social and demographic effects of emigration (age dependency, low education of adult population)
- Social Class Deprivation (applying in rural and urban areas)
  - social class composition, education, housing quality
- Labour Market Deprivation (predominantly urban)
  - unemployment, lone parents, low skills base

### The Basic Model of Affluence and Deprivation

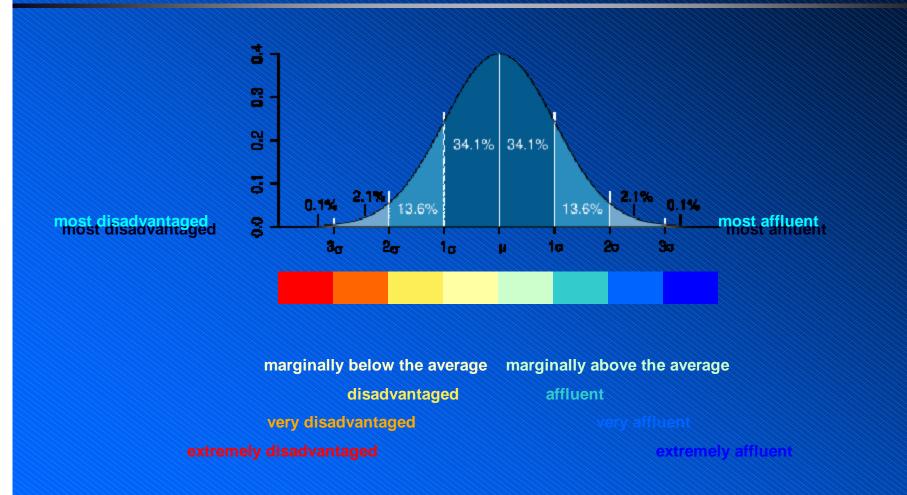

### Dynamic Path Diagram for 1991, 1996, 2002 and 2006

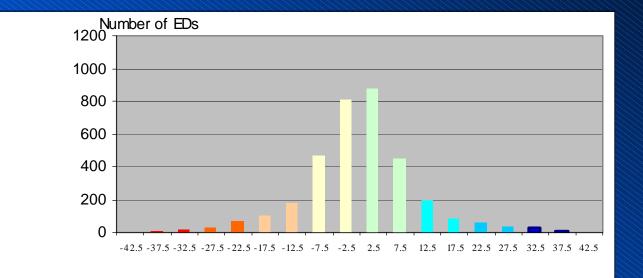

There is a relatively small correlation between the urban and rural components of the index. This confirms the theoretical underpinning of the model which stipulates that urban and rural disadvantage are conceptually different and that the unemployment rate, for example, is not a useful indicator of rural deprivation.

### Assigning Colour Codes

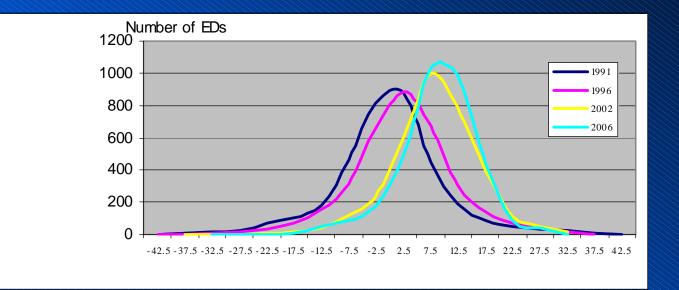

### **Deprivation Scores in 1991**

#### The figure shows the number of EDs in each 1/2 STD interval

### **Change in <u>Absolute</u>** Deprivation Scores, 1991-2006

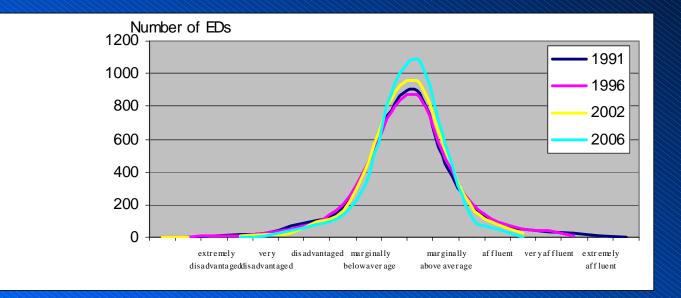

The figure shows the unprecedented growth in Ireland over the past 15 years, with greatest changes occurring in the 1996 to 2002 period.

□ 1991 – 1996: increase in mean scores of 2.4

□ 1996 – 2002: increase in mean scores of 5.8 (8.2 cumulatively)

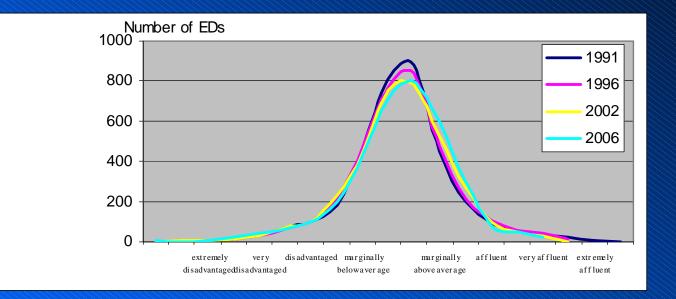

□ 2002 – 2006: increase in mean scores of 0.7 (8.9 cumulatively)

### **Change in <u>Centred</u> Deprivation Scores, 1991-2006**

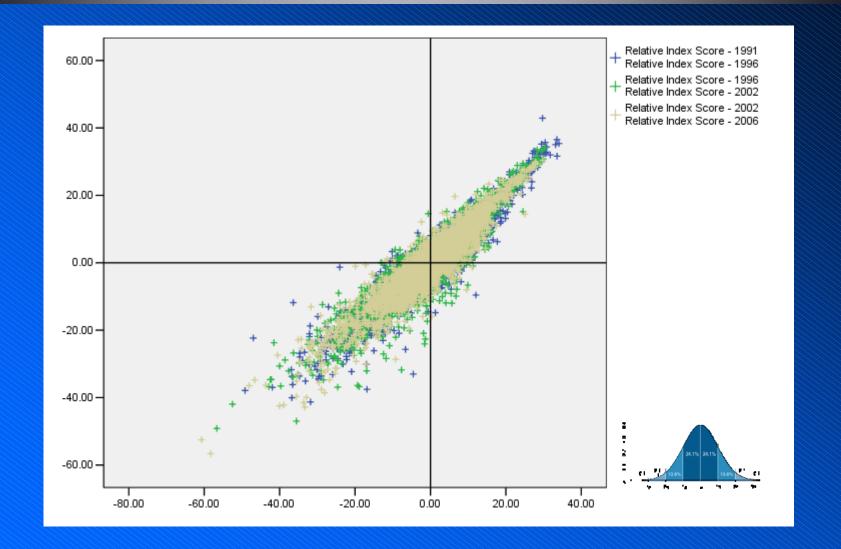

The figure shows the distribution of deprivation scores after 'detrending' the data; i.e. subtracting the average national growth in affluence. The main observation is the gradual narrowing of the distribution over time. This, however, has to be interpreted in the context of a substantial decline in deprivation. As the measurements for each indicator slide down the scale, during this period of rapid growth, the observations tend to cluster more narrowly around the mean.

### **Change in <u>Relative</u>** Deprivation Scores, 1991-2006

The figure shows the final distribution of Relative Deprivation Scores, after controlling for the underlying trend and standardising its spread. The scores thus look at deprivation at each point in time; i.e. as it might be perceived in relative terms.

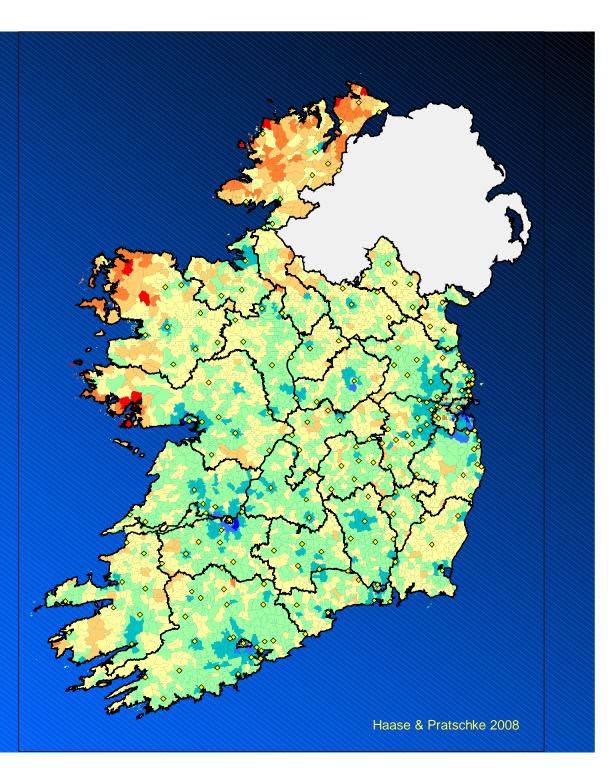

# **Overlay of Paired Relative Index Scores, 1991-2006**

-30 to -20 (4)				
<b>-</b> 50 to -30 (2)				

### **Comparison of <u>Absolute</u> Deprivation Scores, 1991-2006**

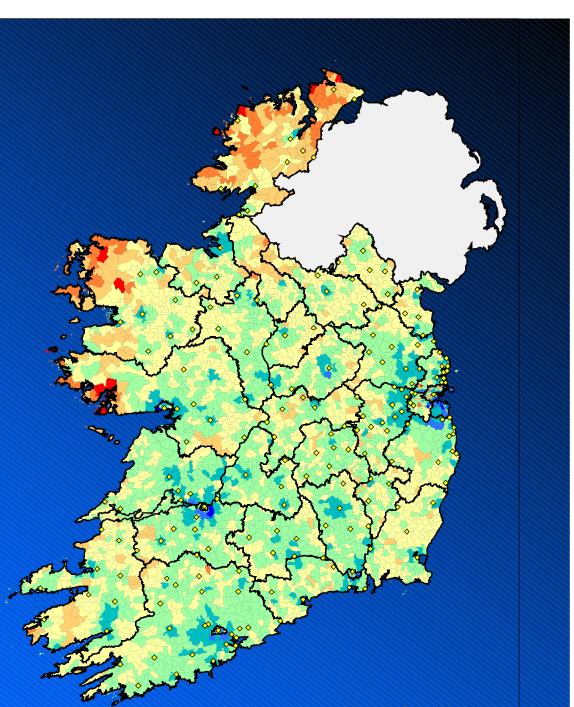

Shows how affluence has grown throughout the whole country.

Greatest change occurred between 1996 and 2002.

- Shows how affluence has grown in concentric rings around the main urban centres, effectively demarcating the urban commuter belts.
- Shows that, with the exception of Dublin Inner City, cities in general have not improved in their affluence as much as the rest of the country.

## **Comparison of <u>Relative</u> Deprivation Scores**, 1991-2006

Excluding consideration of the Five Cities, there are little differences in Relative Deprivation Scores between 1991 and 2006, effectively representing temporary and localised fluctuations only.

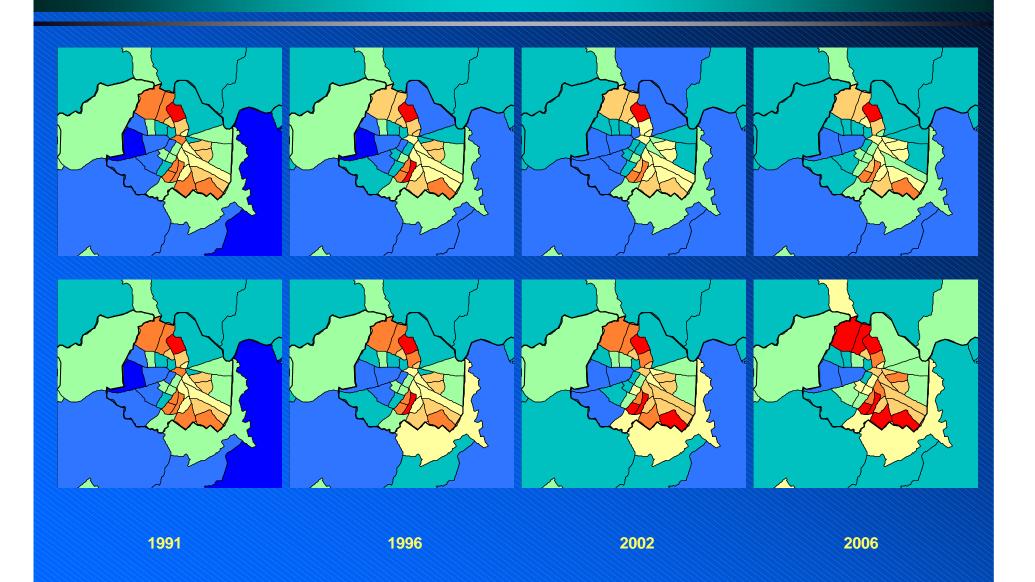

### **Absolute and Relative Deprivation in Dublin, 1991 - 2006**

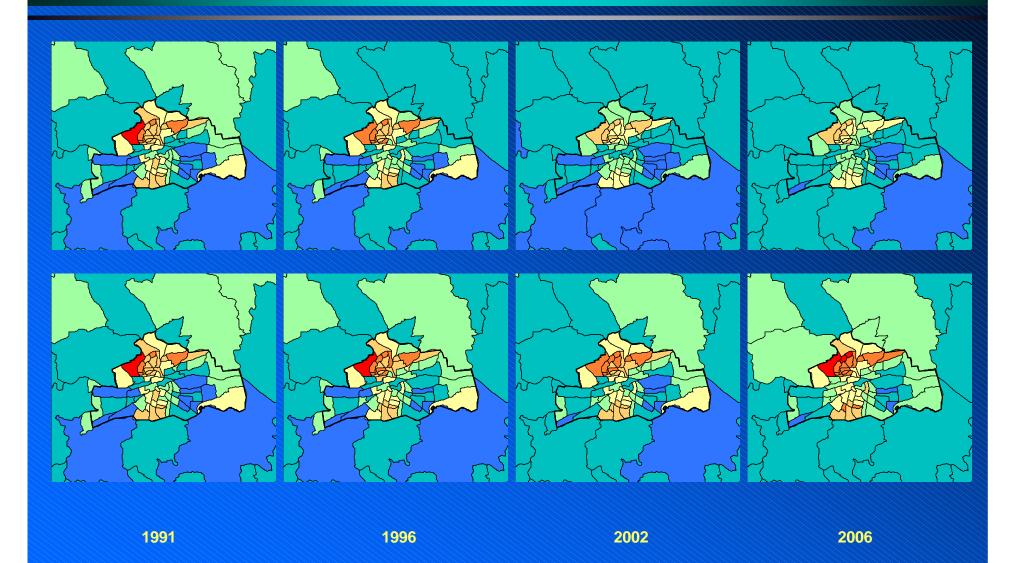

### Absolute and Relative Deprivation in Galway, 1991 - 2006

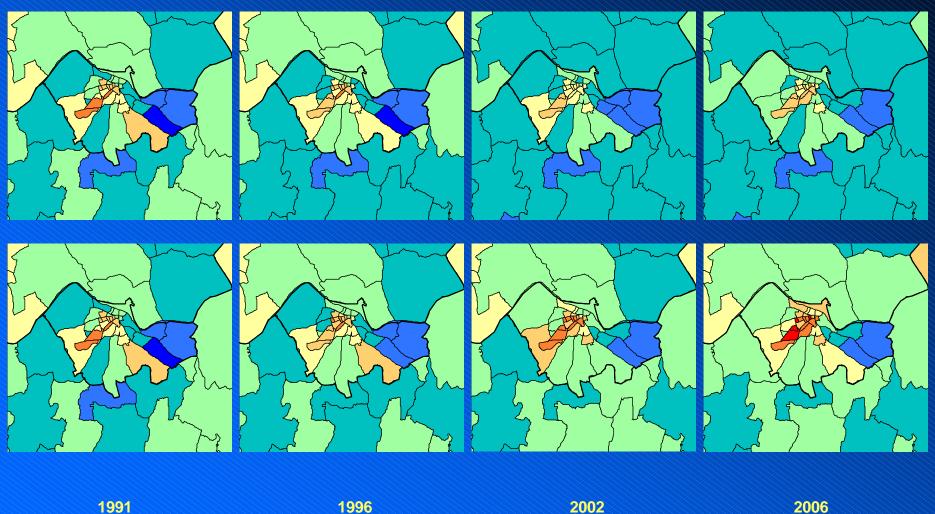

# Absolute and Relative Deprivation in Limerick, 1991 - 2006

### **Absolute and Relative Deprivation in Cork, 1991 - 2006**

# Absolute and Relative Deprivation in Waterford, 1991 - 2006

## **Comparison of <u>Relative</u> Deprivation Scores, 1991-2006**

Whilst Dublin's Inner City has undergone substantial gentrification over the 1991 to 2006 period, there is clear evidence of an increase in relative deprivation in the most disadvantaged urban areas particularly of Limerick, Cork and Waterford.
